

JDFX Releases Kontrol (Alpha Version) Risk Management Platform for MetaTrader Brokers.

PRESS RELEASE: ZURICH, MAY 1ST 2008

JDFX consists of a group of Swiss based companies that provide innovative hardware, software, and connectivity to the professional FX trading community. The JDFX group also has Fund and Fund Management holdings offshore.

“JDFX releases Alpha version of Kontrol for demo servers.”

JDFX releases Kontrol, the total risk management solution for FX Brokers, which interfaces with the popular MetaTrader 4 software. Kontrol is the most advanced real-time risk management package on the market; it is designed to give retail brokers a single point of control over their brokerage. Kontrol offers feed and spread control, dealing automation, risk aggregation, reporting, and intelligent hedging to the top FX liquidity providers and banks.

Connectivity

On the front-end, Kontrol interfaces with MT4, FIX, and ITP (JDFX front-end Trader). On the back-end, Kontrol is connected to the JDFX Core which is a powerful best-price aggregation and order routing engine. The core is fueled by more than 50 currency pairs provided by the largest banks in the Forex market.

Feed Control

Kontrol has built-in filtering algorithms which filter spikes and off-market rates. Spreads and mark-ups are easily configured and the broker can pipe their custom feed into MT4 and FIX servers. In addition, the broker can easily adapt to changing market conditions and economic releases that may cause increased volatility.

Automated Dealing

Kontrol will confirm, reject, or re-quote client trade requests in less than 100 milliseconds by comparing the requested deal price, with the current market price. It automatically scores each client according to their trading patterns in real time, which results in an efficient, high quality, and reliable quality of service to the end client.

Risk Control

Kontrol graphically indicates the broker's global/entity wide exposure using three easy to read tables: Exposure to Clients, Exposure with the Bank(s) and the overall Net Exposure. These tables are updated in real-time and are based on current market prices, the exposure may be displayed in terms of currency pair or individual currency.

Press Release

JDFX Releases Kontrol (Alpha Version) Risk Management Platform for MetaTrader Brokers (continued).

Intelligent Hedging

Kontrol facilitates instant real-time hedging of individual clients, groups, servers, or the entire aggregated currency exposure across all incoming streams, using the least expensive route available. This allows the broker to net incoming deals as often and efficiently as possible. Hedging is done at best-price via the JDFX core.

Reporting

Kontrol offers a robust reporting platform that has many predefined report templates and the ability to build custom reports for in-depth business analysis, customer behavior, regulatory reporting ect.

Regulatory

With increasing regulatory emphasis in G10 jurisdictions on FX brokerage, capital requirements, and reporting, real-time risk control is becoming increasingly important. Kontrol eliminates the inefficiencies and dangers of a Broker calculating risk several times per day from multiple servers using Excel spreadsheet macros.

Kontrol has been designed to fully automate a retail brokerage. It will increase the broker's bottom line by consolidating exposure and lowering execution cost via intelligent hedging. Brokers that use this product will have security knowing that they have the technology to identify and manage risk accurately, reliably and in real time.
